15. Claims 12-32 and 53-61 are presented for examination.

16. The title of the invention is not descriptive. A new title is required that is clearly indicative

of the invention to which the claims are directed.

17. Applicant is reminded of the provision of MEP. 608.02 (q) and (r) regarding a separate

letter to the chief draftsman.

18. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness

rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the

manner in which the invention was made.

19. This application currently names joint inventors. In considering patentability of the claims

under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was

commonly owned at the time any inventions covered therein were made absent any evidence to

the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor

and invention dates of each claim that was not commonly owned at the time a later invention was

made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35

U.S.C. 102(f) or (g) prior art under 35 U.S.C. 103(a).

20. Claims 12-32 and 53-61 are rejected under 35 U.S.C. 103(a) as being unpatentable over

Mason (USPN: 5,268,855).

21. Mason et al. disclose a general purpose programmable media processor having a

instruction path and a data path to digitally process a plurality of media data streams. The media

processor comprises a high bandwidth external interface operable to receive a plurality of data of various sizes form an external source and communicate the received data over the data path, at least one register file configurable to receive and store data from the data path and to communicate the stored data to the data path, and a multi-precision execution unit coupled to the data path. The multi-precision execution unit configurable to partition data received from the data path to account for the elemental symbol size of the plurality of media data streams, and programmable to operate on the data to generate a unified symbol output to the data path. [See abstract, fig. 1, column 2 (line 31) - column 3 (line 61), and column 4 (line 26) - column 6 (line

- 22. Mason did not explicitly give details about operating the media processor at substantially peak rate during the system operation. However, it would have been obvious to one of ordinary skill in the art at the time of invention to modify Mason's system such that the media processor is operated at substantially peak rate during the system operation because it would have allowed the system to process the media information at much higher data rate based on the system requirements, thereby increasing the overall media information processing rate of the system and hence increase the overall performance of the system.
- 23. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.
